Homework 1

- 1. The Iowa data set iowa.csv is a toy example that summarises the yield of wheat (bushels per acre) for the state of Iowa between 1930-1962. In addition to yield, year, rainfall and temperature were recorded as the main predictors of yield.
 - a. First, we need to load the data set into R using the command read.csv(). Use the help function to learn what arguments this function takes. Once you have the necessary input, load the data set into R and make it a data frame called iowa.df.
 - b. How many rows and columns does iowa.df have?
 - c. What are the names of the columns of iowa.df?
 - d. What is the value of row 5, column 7 of iowa.df?
 - e. Display the second row of iowa.df in its entirety.

```
iowa.df<-read.csv("data/iowa.csv", header=T)</pre>
```

- 2. Syntax and class-typing.
 - a. For each of the following commands, either explain why they should be errors, or explain the non-erroneous result.

```
vector1 <- c("5", "12", "7", "32")
max(vector1)
sort(vector1)
sum(vector1)
b. For the next series of commands, either explain their results, or why they should produce errors.
vector2 <- c("5",7,12)
vector2[2] + vector2[3]

dataframe3 <- data.frame(z1="5",z2=7,z3=12)
dataframe3[1,2] + dataframe3[1,3]

list4 <- list(z1="6", z2=42, z3="49", z4=126)
list4[2]]+list4[4]</pre>
```

- 3. Working with functions and operators.
 - a. The colon operator will create a sequence of integers in order. It is a special case of the function seq() which you saw earlier in this assignment. Using the help command ?seq to learn about the function, design an expression that will give you the sequence of numbers from 1 to 10000 in increments of 372. Design another that will give you a sequence between 1 and 10000 that is exactly 50 numbers in length.
 - b. The function rep() repeats a vector some number of times. Explain the difference between 'rep(1:3, times=3) and rep(1:3, each=3).
